

Mobile Friendly Checklist

GeorgiaGov Platform Guides

Before we switch your site to a Responsive theme, you will need to review the rest of your website content at a small screen view on your Staging site (your Account Representative will provide the link), paying special attention to the following:

- Images** manually resized to a different resolution than the actual image.
 - Create a version of the image that matches the desired largest dimensions.
- Tables** not used for tabular data
 - Convert to text
- Image Maps** (images that have multiple “hot spots” to click from one image)
 - Review and test functionality, and remove altogether when possible
- Related Files** (file attachments)
 - Convert attached files to web pages or PDFs whenever possible
- iframes and other embedded content** (non-Drupal content embedded in a page)
 - Review any content that you display from an external source via javascript or an iframe, and use embedresponsively.com to convert the embed code to responsive compatible code.
- Content**
 - Clean up, bullet point and remove unnecessary content wherever possible
- Menus**
 - Deep menu structures are difficult to navigate on a mobile device. Consolidate menus when possible.
- Content landing pages** should provide links to child pages
 - Add links to internal pages when needed
 - If the menu item has no content, convert the menu item to <nolink> when relevant
- Utility Navigation** (nav links above the Search box)
 - These links float to the bottom of the page on the Mobile breakpoint
 - Consider consolidating menus so important Utility links (such as Contact Us) fits in the Main Menu
- Homepage Boxes**
 - Review order of boxes, and alert your Account Representative if you would like to reorder them.
 - Consider removing your Image Rotator – it takes up a lot of space

Please Note – although you are reviewing content on the **Staging** site, any changes to content should be done on the **Live** site.
